

Gain: 1.1 – Viewing angle: 150° – Thickness: 0.41 mm – Reel height: 240 cm – Class: M2 – Holes: 35.800/mq ø 0.5 mm

This acoustically transparent front projection surface is made of white PVC. Its microperforation – completely invisible during projection even from very up close – makes this fabric particularly suitable for the making of small size screens for home theatre or for digital Cinema use. Its technical features are similar to those of the White-Light fabric, and it has the same thickness and the same superficial embossing, which guarantees perfect colour evenness and an extremely high image definition.
