

Gain: 1.05 – Viewing angle: 150° – Thickness: 0.41 mm – Reel height: 240 cm – Class: M2 – Holes: 35.800/mq ø 1.2 mm

Acoustically transparent front projection surface, ideal for the making of large size screens. Its technical features are similar to those of the White-Light fabric; it also features its same thickness and superficial embossing, which guarantees a perfect uniformity in colour during projection, as well as an extremely high image definition. Its distinctive perforation makes it “acoustically transparent”, allowing for the installation of sound sources behind it. It is not particularly suitable for small size screens or for those cases in which the public is very close to the screen.
