

Gain: 1.15 - Viewing angle: 150° - Thickness: 0.41 mm - Reel height: 240 cm - Reaction to fire: class M2

This pure white PVC projection surface is slightly embossed on the surface to guarantee perfect colour evenness and a very high image definition. Its wide viewing angle and the 1.15 gain make it especially suitable for large size showings, without "spot" effect even when using very bright projectors. Its 0.41 mm thickness ensures perfect flatness even with larger motorised screens, and its excellent workability allows for the making of invisible seams and fabrics with a black perimeter masking. Its versatility makes it our reference fabric. Because of the white backing of the fabric, its use is advisable only if there are no parasite lights or windows behind the screen.
